

Soil Chemical Analysis

Advanced Course

***A manual of methods useful for instruction
and research in soil chemistry, physical
chemistry of soils, soil fertility, and
soil genesis***

M. L. Jackson

SOIL CHEMICAL ANALYSIS : ADVANCED COURSE

A Manual of methods useful for instruction and research
in soil chemistry, physical chemistry of soils,
soil fertility, and soil genesis

2nd edition

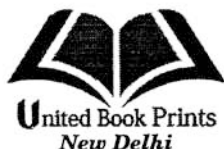

by

M.L. Jackson

Professor of Soil Science

A revised edition with a new introduction by Associate Professor Phillip Barak,
Department of Soil Science, University of Wisconsin-Madison.

Includes biographical material on M.L. Jackson,
memorial tributes, and a list of Jackson's career
publications and graduate students.

2nd Reprint in India by:

List of Tables

	Page
1-3 Radius ratio and oxygen coordination number for a number of cations	12
1-5 Percentage ionic character of cation bonding with oxygen	16
1-7 Polymorphism and isomorphism in CaCO_3	20
2-1 Recovery of dissolved oxides in various extractions	91
3-1 Sand, silt, and clay fractions obtained for analysis by diffraction, thermal, microscope, and other methods	113
3-2 Time required at various temperatures for gravity sedimentation of soil particles, a specific gravity of 2.65 being assumed and a 5-cm suspension depth being employed	114
3-3 Recovery of mineral fractions, expressed in grams and calculated as percentage of mineral portion, of mineral plus oxide portion, and of original sample weight of soil	126
3-4 Time required at various centrifuge speeds and temperatures for sedimentation of particles, an International No. 2 centrifuge with No. 240 head being employed with 100-ml tubes, a 10-cm suspension depth, a 1-cm of sediment, and a 9 cm net depth of fall	128
3-5 Temperature and specific gravity correction constants	131
3-6 Flow rates and supercentrifuge speeds for various particle limiting diameters at 25°C with a Sharples "Laboratory Model" air-turbine supercentrifuge equipped with a clarifier bowl	157
3-7 Particle size for minerals of various densities, calculated for the -0.08 μ separation at 1.52 specific gravity	157
4-1 Guide to quantity of an ethanol-glycerol solution, which is 10% glycerol by volume, needed to solvate various size fractions	185
4-2 Relation of particle size to appearance of diffraction pattern	214
4-3 Standard diffraction spacings of minerals common to soils or occasionally found in soils	220
4-4 Standard entry form for qualitative analysis of powder diffraction patterns	223
4-9 Interplanar spacings for angle 2θ Cu K_α	224
5-1 Cation exchange capacity of phyllosilicate clay minerals	263
6-1 Temperature of water loss from hydroxyl compounds	291
6-2 Thermal gravimetric and differential thermal data for selected minerals	300
7-1 Specific surface, m^2/g , calculated for spherical particles of varying diameter	329
7-2 Calculated specific surface for fine silt and clay fractions of the expanding 2:1 layer silicates, montmorillonite and vermiculite, of unit cell weight of 720, layer specific gravity of 2.65 and thus of planar specific surface of 808 m^2/g	332
8-1 Wave number and wave length of ultraviolet, infrared and microwave regions of the electromagnetic spectrum	385

	Page
8-2 Infrared absorption spectrophotometry range as influenced by substance employed in optical components	387
8-3 Stretching wave numbers for varying phyllosilicate octahedral compositions	395
8-4 Bending wave numbers of several montmorillonites	395
9-1 Comparison of magnifiers	417
10-1 Specific gravity grouping of minerals	474
10-2 Liquids of heavy specific gravity for density distribution spectrum of soil sample	484
10-3 Refractive index liquids	487
10-4 Refractive index liquids selected for high dispersion suitable for the Becke line color method	487
11-1 Techniques of soil mineral analysis and limitations when employed singly	512
11-2 Summary of factors for conversion of residue K_2O , Na_2O , and CaO to the respective endmember equivalent of feldspars	517
11-3 Factors for equation 11-8 to obtain the quartz content	517
11-12 Diagnostic properties of amorphous mineral colloids of soils	525
11-13 Percentage composition of some common oxide minerals and feldspar	539
11-14 Percentage composition of some common layer silicates	540
11-15 Potassium content calculated for clay-size mica of varying particle size and number of crystal layers	544
11-16 Sample calculation of the general formula for the 0.2 to 0.08 micron fraction of Ordovician bentonites	547
11-17 Relative stability indexes of clay size minerals	561
13-1 Influence of soil moisture content on soil pH value observed and pH measurement in 0.01 M $CaCl_2$ and in 1 N KCl	610
14-1 Scale of reduction potentials and oxidation potentials measured with platinum electrode	652
14-2 The measured soil cell potentials and reduction potentials of soil systems	663
15-1 Properties of important stable and radioactive isotopes of elements essential to plant growth	702
15-2 Thickness of material necessary to stop completely the 1.72 mev beta radiation of ^{32}P	711
16-1 Analysis of solutions from the electro dialysis electrode chambers	810
17-1 Data for pH titration curve of colloidal electrolyte or soil	845

Table of Contents

	Page
List of Tables	vi
List of Figures	viii
Preface	xiii
Introduction	xv
List of Pages	xvii
List of Missing Pages	xviii
To the Reader	xix
Laboratory Report Outline	xx
Laboratory Orderliness	xxi
 Chapter 1. Atomic Models of Mineral Crystals and Organic Molecules	 1
Chapter 2. Dispersion of Soil Minerals	27
Chapter 3. Mineral Fractionation for Soils	100
Chapter 4. X-Ray Diffraction Analysis of Soil Minerals	169
Chapter 5. Cation Exchange Capacity Determination for Soils	252
Chapter 6. Thermal Analysis of Soil Minerals	286
Chapter 7. Specific Surface Determinations of Soil Minerals	328
Chapter 8. Infrared Absorption Analysis of Soils	381
Chapter 9. Electron Microscope Examination of Soils	401
Chapter 10. Light Microscope Determinations for Soil	468
Chapter 11. Selective Dissolution and Chemical Allocation of Soil Minerals	510
Chapter 12. Soil Organic Matter Separation and Characterization	570
Chapter 13. Cation Activity Measurement for Soils	595
Chapter 14. Redox Potential Measurement for Soils	649
Chapter 15. Isotopic Analysis for Soils	697
Chapter 16. Soil Acid Production by H Resin or Salt-Acid Treatment	798
Chapter 17. Cation Exchange Equilibrium of Soil Colloidal Acids with Bases	838
Index	877
 Appendix A. Obituary	 893
Appendix B. University of Wisconsin–Madison Faculty Senate Memorial Resolution No. 1725, September 29, 2003	 895
Appendix C. Francis D. Hole “In Recognition of Marion L. Jackson on the Occasion of His Sixty-First Birthday, November 30, 1975”	 897
Appendix D. Richard Corey “Marion Leroy Jackson–Soil Scientist of Worldwide Influence,” 1991	 903
Appendix E. Career Publication List	907
Appendix F. Graduate Student List	925

List of Figures

	Page
1-7 Size as a function of atomic number (Z). Note periodicity	7
1-8 Atomic radii, a balance of forces	8
1-9 Proton scale of size	9
1-10 Relative sizes of natural bodies	10
1-12 Face-centered cubic arrangement	13
1-13 Hexagonal close packing of spheres	14
1-15 Calcite, rhombohedral on (111), hexagonal on (0001)	20
1-17 Isomorphous substitution in carbonates	20
2-1 Construction of rubber plunger for the dispersion of soil or colloid in a centrifuge tube	32
2-9 Imogolite structure	77
2-11 Imogolite net positive charge in acid dispersion	77
3-1 Comparison of size fractions employed in mineralochemical analysis and physical analysis of soils	103
3-2 Flow sheet for mineral colloid dispersion and separation for analysis	111
3-3 Nomograph of particle settling time under gravity acceleration	115
3-4 Apparatus for wet-sieving of dispersed soil suspension to effect the 50- μ m separation	124
3-5 Principles of sedimentation in single-layer centrifuge method	129
3-6 Nomograph of particle settling in single layer centrifuge method	130
3-8 Principles of sedimentation with an angle-head centrifuge	146
3-9 Principles of sedimentation with 2-layer method. (a) Use in conventional tube-centrifuge, with top view showing direction of fall toward tube walls. (b) Use in Sharples supercentrifuge	150
3-9a Flow sheet for allophane-imogolite separation	152
3-10 Flow of suspension into stilling basin (a) in front of a weir in a ditch; (b) along margin of sediment on liner of supercentrifuge bowl. As sediment load is dropped the suspension density decreases and the lighter effluent flows out of the basin or bowl	154
3-11 Suspension density gradients in the supercentrifuge bowl. (a) analogue in a cylinder under gravity with suspension feeding in at bottom; (b) centrifugal force and density gradients in bowl; (c) flow direction in bowl; (d) cone of sediment deposited in bowl	154
3-12 Nomograph of suspension flow rates through Sharples Model supercentrifuge at 25° as a function of soil particle diameter, particle specific gravity, and centrifuge speed	158

	Page
4-1 Electromagnetic spectrum of radiation, illustrating the extreme range of wave length extending through 18 magnitudes of which only a half magnitude is visible and two to four magnitudes are classified as x-rays	174
4-2 Angle of diffraction from a crystal, the Bragg law	175
4-3 Production of a powder diffraction pattern with cylindrical film x-ray diffraction camera	177
4-3a Crystallographic relationships	178
4-10 Suction apparatus for porous tile	196
4-4 X-ray diffraction pattern of an illite-montmorillonite interstratified mixture with different methods of solvation	197
4-5 Diagram of the fundamentals (A) of the conventional x-ray generator including the x-ray and valve tubes, and (B) the voltage pulses used in x-ray generation ..	202
4-6 Characteristic K_{α} and K_{β} x-radiation maxima of Cu superimposed on a continuous spectrum and beta-filtration with Ni filter	202
4-7 Collimation of x-ray beam: (A) by rear and front pinhole or slit; (B) by Soller slit applied to a broad x-ray beam	204
4-8 Principles of the focusing powder, x-ray spectrometer with Geiger counter recorder	206
4-14 Wedge-mounted powder sample showing relation to x-ray beam and diffraction angles	212
4-15 Box mounting for diffraction	212
4-16 Measurement of diffraction line broadening	216
4-18 Diagram showing the production of a powder diffraction pattern with flat film recording by transmission and back-reflection from the sample	226
4-19 Absorption edges on photographic film arise from the specific absorption of x-rays by Ag and Br atoms of the film	227
4-20 Common binary interstratified systems of layer silicate minerals	230
4-21 XRD patterns of complex phyllosilicate interstratification of minerals	231
6-1 Dehydration curves of minerals	292
6-2 Dehydration curves of montmorillonite group as affected by isomorphous substitution in octahedral layer	295
6-3 Dehydration curves of soil colloids	299
6-6 Karl Fischer titration flask assembly	306
6-11 Differential thermogram of halloysite	312
6-13 Thermocouple circuits and specimen holder (top and side views) for differential thermal analysis	314.1

	Page
6-17 Differential thermograms of minerals	321
6-19 Slope ratio of kaolinite endotherm	325
7-1 Cross section of vacuum oven for obtaining relative glycerol vapor pressure	338
7-2 Flow sheet for specific surface determination	344
8-1 Various vibrational modes of a CO ₂ molecule	385
8-2 Energy levels of infrared absorption	385
8-3 Infrared absorption of two micas: (a) of a phlogopite flake, showing increasing absorption at 3710 cm ⁻¹ with increasing angle of incidence and (b) of a muscovite flake, showing stronger absorption with little variation in absorption at 3620 cm ⁻¹ with angle of incidence	394
9-1 Size scale and range of analytical techniques	405
9-4 Analogy in principle of the electron microscope to light microscope	414
9-7 Shadow casting on an electron microscope specimen	429
9-8 Details of metal deposit in shadow casting	429
9-16 Evacuation sequence in developing high vacuum	432
10-1 The light microscope	486
11-3 Flow sheet for isolation of quartz	521
13-2 Arrangement in the clay membrane electrode for measurement of metallic cation activity	612
13-3 Donnan membrane equilibrium	617
14-1 Hydrogen electrode arranged for pH measurement	653
14-3 The EMF (E, or MV) is (+) when the left hand half-cell (<i>furnishing</i> electrons) is connected to the (-) pole of the potentiometer and the right hand half-cell (<i>accepting</i> electrons) is connected to the (+) pole of the potentiometer	662
14-5 The relation of oxidation potential of pH	666
15-3 Ionization pulse size produced by a single particle or proton of tracer radiation as a function of voltage applied across gas volume	717
15-4 Counting-rate voltage curve for Geiger-Muller counter tube	717
15-7 Plant tissue briquet-forming dies (a) for flat briquets; (b) for annular briquets	742
15-8 Sample holder and guard plate in position before end-window Geiger-Muller tube	743

	Page
15-9 Flow sheet for ^{32}P radiochemical analysis of plant tissue.....	744
15-10 Counting rate of briquet as a function of its thickness	746
15-11 Linear relation of counting rates of briquet and ^{32}P concentration in the tissue	746
15-12 Filtration apparatus for collection of $\text{MgNH}_4\text{PO}_4 \cdot 6\text{H}_2\text{O}$ precipitate on a planchet	752
16-1 Diagram of electrodialysis cell	806
17-1 pH titration curves of a colloidal electrolyte and pure water	846
17-2 Concentrations in equivalents of various ions in the $\text{CaCO}_3\text{-CO}_2$ system at various CO_2 pressures	854

Preface

Original literature in which the various procedures have been described or studied critically is cited in footnotes. The author has made his writings of the procedures freely available to all through the many years during which the material for this book was being prepared. The many modifications and improvements developed by the author and his students thus made possible are made available for current use. This published and copyrighted book may (and should) be cited as a reference, adapted from the following:

Jackson, M.L. 1985. *Soil Chemical Analysis—Advanced Course*. 2nd Edition, 11th printing. Published by the author, Madison, Wis. 53705

The author wishes to express sincere appreciation for many constructive suggestions received from students and colleagues on ways to improve the clarity of the presentations and to Mrs. Chrystie M. Jackson for her constant encouragement and patience.

—M.L. Jackson
Madison, 1985
